

Our group's collaborative research aim was to raise additional funds to support research, development, and commercialization of climate-change-fighting technologies such as wind, solar, and hydropower. We divided the responsibilities in our group according to who would be assigned what. Dita and Malek conducted research on solar, wind, and hydropower and produced three separate paragraphs for each. Disastrous Events was authored by (Aishah) and (mimi) were in charge of the finances. I was the one who wrote the Government Letter. When working on this project, we efficiently divided the task. We created a group chat and a zoom link to keep everyone on task or if assistance was required. Everyone was polite and welcoming. The job was nicely organized, which was one advantage. We exchanged words with one another. Everyone pitched in and did their best to assist everyone who needed it. The group member who was having trouble received some assistance by being provided resources that would help. Cons included the fact that I wasn't mentally well alongside with having covid. Moreover, I had no idea which group I belonged to. I was able to join a group of pleasant and helpful people with the assistance of the professor. Without any frustration, they assisted me in getting back on track. I received a comprehensive description of what task they wanted me to work on. It was difficult at first, but I eventually understood everything. They also gave me their email addresses in case I needed assistance. Everyone in the group was considerate of one's space. We all did a great job working together. Even though this project was last-minute, I enjoyed working on it. It was a little challenging for me to manage my time well, but after rearranging a few tasks, I understood it. I asked my peers to review my government letter to see if I was missing any important details or just for their feedback so I could figure out where I could improve.

My target audience includes minorities, POC (People of Color) in poverty, and government officials. I related with them because I am a person of color. People of color, particularly those living in poverty, have limited rights. Their options are limited to shelter, food,

and clean water. I have also gone through a hurricane, so I understand how frightening it is and the impact of a catastrophic event on people, particularly those who live in an unstable environment. If the government does not act before the peak of climate change, these people will lose hope and may be completely wiped out. With this being said, we must take action to save the lives of these innocent people with the aid of innovative solar, hydro, and wind technology. The standard of living for people must be raised. There will be a loss of American labor if they are eliminated. Government officials must take precautions. In order to protect people from catastrophic occurrences, we need to control climate change and enhance funding for individuals. This issue needs to be taken into account by government officials, who should also provide funding for such technology. When such events occur as a result of climate change, the government must provide more assistance to the people. We intend to advertise this issue through advertisements to demonstrate the detrimental impact of climate change. For this initiative, we also established a website to raise awareness, as well as a children's science book.

Pathos and logos were the rhetorical appeals I utilized in my PAC. By utilizing real-life examples of disastrous events to persuade people that this is a significant issue that must be addressed. Logos helped people grasp how, rationally, if the government does nothing or if we as individuals do not increase awareness about climate change, our future does not appear to be bright. By presenting rational facts about how and what solar, wind, and hydro technologies will aid. The most crucial aspect of how they will improve climate change is that funds must be provided to develop these technologies if we are to protect the future. Pathos was used to raise awareness about how people of color in poverty face greater challenges than others. This helps others to put themselves in their shoes and comprehend how hard it is to live in such situations, but with the dangers of catastrophic events, it leaves them with hope. It emphasizes that we should not just sit at home or dismiss it since it could happen to us one day. I would believe that these appeals have been rather successful since they allow individuals to be more considerate

in order to promote awareness. It also educates people about the detrimental implications of climate change. That a small difference can make a great difference.
